GROWTH RETAINER PROPOSAL

Button Eyes Resort SEO Audit, Recovery Roadmap, and Growth Proposal

A validated audit report and 90-day growth proposal built from the shared source files, corrected with live verification, and structured to turn this audit into a measurable SEO recovery and booking-growth engagement.

Prepared by SEO With Faiz

Prepared for Button Eyes Resort

Date: 25 May 2026

Status: Audit stage

Launch pricing included

PREFERRED 90-DAY RETAINER

INR 1,50,000 + GST

90-day SEO recovery and growth foundation

Suggested billing: INR 50,000 + GST per month for 3 months

Relationship-building rate for the initial recovery phase

CRITICAL BLOCKERS

4

Discovery, duplicate content, content quality, conversion UX

VALIDATED CORRECTIONS

4

OG, schema, alt text, and H1 assumptions corrected

IMMEDIATE HORIZON

90 days

Cleanup first, growth second

DATA MATURITY

Early

GA4 and GSC setup is too recent for a mature baseline

EXECUTIVE SUMMARY

Search visibility is being limited by weak inputs, not by a lack of opportunity.

Button Eyes Resort already has a live site with indexable core pages. The bigger problem is that search engines and users are being asked to trust a site that still contains duplicate blog URLs, weak commercial page targeting, placeholder content, a broken sitemap reference, and visible template leftovers.

Why a retainer is the right model

- The problems are interconnected across crawl health, content quality, metadata, and booking UX.
- Search Console and GA4 baselines are still maturing, so follow-through matters more than a one-time handoff.
- Several recommendations need rechecking after implementation, which is where static audits lose value.
- The best chance of visible progress comes from cleanup plus continued execution, not diagnosis alone.

What happens in the first 30 days

- Sitemap and indexation cleanup is prioritized first.
- Duplicate blog and low-value URL decisions are locked down.
- FAQ, experiences, and core commercial pages get rewrite direction.
- Measurement baselines are cleaned up so future gains can be tracked credibly.

What was reviewed

Open full shared audit folder

Master source folder containing the audit documents, crawl exports, and notes.

BUTTONEYES RESORT AUDIT SHEET

Primary issue inventory used as the base audit sheet.

Button Eyes - Indexing Issues

Indexed URL list and response-code checks.

Button Eyes Resort - URL Indexing

URL inventory including duplicate and low-value blog URLs.

Screaming Frog Crawl Data - Raw

Raw crawl output covering titles, canonicals, headings, media, and technical signals.

GA4 And GSC Data

Analytics and Search Console setup notes, with limitations because setup is recent.

Button Eyes resort Keyword list

Commercial and local-intent keyword targets for Hyderabad resort queries.

How gaps were filled

- Live checks across 11 core URLs
- Validation of 6 blog URLs and 2 category URLs
- Verification of robots.txt and sitemap behavior
- Manual checks of page structure, metadata, schema, and visible UX issues

Live robots.txt

Homepage reviewed live

FAQ page reviewed live

Experiences page reviewed live

Blog index reviewed live

PRIORITY FINDINGS

Highest-risk issues that need immediate attention

Broken sitemap discovery

What was verified: robots.txt points to https://buttoneyes.in/sitemap_index.xml, which returns 404.

Business impact: Crawl discovery weakens, new pages surface more slowly, and confidence in site structure drops.

[Live robots.txt](#)

[Broken sitemap endpoint](#)

[Audit sheet](#)

Duplicate blog URLs remain indexable

What was verified: Duplicate post pairs are live, indexable, and self-canonicalized instead of consolidating to a preferred version.

Business impact: Relevance splits, crawl budget is wasted, and low-value pages occupy index space that should support commercial intent.

[URL indexing source doc](#)

[Sample duplicate post](#)

[Second duplicate post](#)

Placeholder and irrelevant content

What was verified: The FAQ page contains Lorem Ipsum, the experiences page contains placeholder amenity copy, and the blog contains irrelevant template travel posts.

Business impact: Trust drops, local topical relevance weakens, and ranking potential for Hyderabad resort intent stays capped.

[FAQ page](#)

[Experiences page](#)

[Blog index](#)

[Sample template blog post](#)

Broken booking and search UX

What was verified: A booking shortcode is visibly rendering on public pages instead of a working booking or search interface.

Business impact: Conversion confidence drops, pages look unfinished, and booking-intent traffic faces avoidable friction.

[Homepage](#)

[Blog page](#)

[Bookings page](#)

Weak commercial page structure

What was verified: The homepage and bookings page are missing an H1, /experinces/ is misspelled, and metadata is often generic or error-prone.

Business impact: Click-through, intent alignment, and quality signals all stay weaker than they should be.

[Screaming Frog crawl data](#)

[Homepage](#)

[Bookings page](#)

[Misspelled experiences URL](#)

Mobile performance remains weak

What was verified: Source audit reports mobile 34, desktop 65, FCP 3.1s, LCP 8.2s, and CLS 0.01. Crawl data also supports a heavy media and plugin footprint.

Business impact: Rankings, engagement, and booking-intent conversion can all underperform on mobile.

[Audit sheet](#)

[Screaming Frog crawl data](#)

CORRECTIONS

Source-audit claims that required correction after validation

Open Graph and social metadata

The source audit marked these as missing. Sampled live pages did contain `og:title`, `og:description`, and `og:image`.

The real issue is quality and consistency, not total absence.

[Original audit sheet](#)

[Homepage checked live](#)

Structured data

The source audit marked schema as missing. Sampled live pages contained JSON-LD for organization, website, webpage, and article-level content.

Schema exists, but it does not offset content quality and duplicate indexation issues.

[Original audit sheet](#)

[Sample article page](#)

Alt text assumptions

The source audit suggested blanket image alt failures. Sampled core pages had image alt attributes present.

Media weight, image strategy, and overall content quality are the more pressing concerns.

[Original audit sheet](#)

[Gallery page](#)

Heading structure

The source audit implied all pages were missing H1s. That is not accurate.

The most important H1 gaps are the homepage and bookings page, not the entire site.

[Screaming Frog crawl data](#)

[Homepage](#)

[Bookings page](#)

Important limitation

Google Search Console page indexing is still processing, and GA4 / GSC were only recently set up. That means coverage and traffic baselines are not mature enough yet to support a detailed performance story. The strongest present-tense value here is the cleanup roadmap, not a mature results dashboard.

ROADMAP

Recommended 90-day recovery path

PHASE	TIMELINE	PRIMARY WORK
Phase 1: Technical stabilization	Week 1 to Week 2	Fix sitemap generation, resubmit in Search Console, decide duplicate URL handling, remove visible shortcode output, and correct structural issues on core templates.
Phase 2: Content and on-page cleanup	Week 2 to Week 5	Rewrite homepage, FAQ, experiences, and bookings direction; remove or replace irrelevant blog content; improve metadata and intent mapping for core commercial pages.
Phase 3: Local growth foundation	Week 5 to Week 12	Map target keywords, improve local entity signals, strengthen internal linking, set reporting definitions, and re-audit implemented changes.

Immediate KPI targets

- Valid live sitemap submitted and crawled
- Duplicate blog URLs removed or consolidated
- Placeholder content removed from FAQ and experiences pages
- Homepage and bookings page fixed structurally

Short-term SEO targets

- Unique titles, meta descriptions, and H1s on key commercial pages
- Cleaner index profile in Search Console
- Better topical fit for Hyderabad resort intent
- Improved landing-page trust and conversion readiness

Business risk if cleanup is skipped

- Traffic work compounds slowly or not at all
- Search engines keep surfacing low-value URLs
- Users hit broken or unconvincing experiences
- SEO spend gets diluted by avoidable technical debt

What success should look like by day 90

A cleaner index profile, stronger commercial pages, improved local relevance, and a much more reliable foundation for organic bookings and enquiry growth. The goal of this phase is not vanity reporting. It is to make the website genuinely ready for sustained SEO work that can be scaled with confidence.

EVIDENCE APPENDIX

Data sources and claim-level references

Primary data links

Shared Google Drive folder

Master folder for all supplied audit assets.

Audit sheet

Primary issue list, performance notes, and action comments.

Screaming Frog crawl data

Technical crawl export covering URLs, headings, metadata, and assets.

GA4 and GSC notes

Setup-stage analytics notes and source limitations.

Live verification links

robots.txt

Shows the sitemap path currently referenced by the site.

Broken sitemap endpoint

Returns 404, which is central to the discovery issue.

Blog index

Shows duplicate and irrelevant blog content in a live context.

FAQ page

Shows placeholder FAQ content.

Experiences page

Shows the misspelled URL slug and placeholder amenity descriptions.

CLAIM IN THIS REPORT	DRIVE SOURCE	LIVE CHECK
The sitemap/discovery layer is broken.	Audit sheet	robots.txt and sitemap endpoint
Duplicate blog URLs remain live and indexable.	URL indexing document and Indexing issues sheet	Duplicate post example and blog index
Important pages contain placeholder or irrelevant content.	Audit sheet	FAQ , experiences , blog , and sample blog post
Metadata and heading quality are inconsistent on core pages.	Screaming Frog crawl data	homepage , bookings , and contact
Performance risk is real, but analytics baselines are still immature.	Audit sheet , GA4 / GSC notes	homepage reviewed live
Some original audit claims were stale or overstated.	Audit sheet	sampled live pages and sample article page

RECOMMENDED ENGAGEMENT

Commercial proposal

My recommendation

The 90-day retainer is the strongest fit because the site does not only need an audit readout. It needs cleanup, implementation guidance, revalidation, and consistent follow-through across technical SEO, local intent, and page quality. The pricing below has been kept intentionally friendly for the first phase so the engagement can start with momentum and grow from results.

CLEANUP SPRINT

SEO cleanup sprint only

INR 60,000 + GST

3-week one-time engagement

- Sitemap and indexing corrections
- Duplicate URL cleanup recommendations
- Metadata recommendations for priority pages
- Content gap summary and final handoff report

RECOMMENDED

90-day SEO recovery and growth foundation

INR 1,50,000 + GST

INR 50,000 + GST per month for 3 months

- Technical recovery and indexation cleanup
- Commercial page and metadata correction
- Keyword mapping and local SEO foundation
- Monthly reviews, tracking, and implementation QA

SEO recovery plus content execution

INR 2,10,000 + GST

INR 70,000 + GST per month for 3 months

- Everything in the recommended package
- Hands-on rewrite support for priority pages
- Stronger monthly content support
- Tighter implementation follow-through

Why the recommended option is the best fit

- It covers cleanup, correction, and local SEO foundation in one connected plan.
- It gives enough time to implement, verify, and adjust instead of stopping at recommendations.
- It creates a realistic window to show progress that can justify a longer-term engagement.
- It keeps the starting investment reasonable while preserving enough scope to make the work count.

What happens after approval

- Week 1 kickoff and access handoff
- Technical cleanup priority stack delivered first
- Commercial-page rewrite direction and metadata correction next
- Monthly review checkpoints with visible action tracking

Recommended scope includes

- One prioritized SEO roadmap
- One technical fix tracker
- Metadata recommendations for up to 15 priority URLs
- Content recommendations or rewrite briefs for up to 5 priority pages
- Duplicate content cleanup plan for blog and archive URLs
- One 90-day keyword and content map
- Two review calls per month

Commercial assumptions

- WordPress and relevant admin access will be provided
- One decision-maker or point of contact will approve changes
- Implementation support is available on the website side
- This is not a full redesign or custom booking-engine build
- Third-party licenses and ad spend are outside the quoted fee

Optional add-ons

- Additional commercial page rewrite: INR 6,000 per page
- SEO blog writing with optimization brief: INR 3,500 per article
- Google Business Profile management: INR 10,000 per month
- Local citation cleanup and submission: INR 12,000 one-time

Payment terms

- Monthly retainers are billed in advance
- One-time work: 50% advance and 50% before final handoff
- Additional scope is billed only after written approval

Bottom line

The opportunity is real, but the current setup is leaking value through duplicate content, weak page targeting, and technical discovery issues. The recommended engagement is designed to stabilize the site first, then build a cleaner growth foundation over the next 90 days.

APPROVAL

Approval and kickoff

On approval, kickoff can begin with access collection, final scope lock, and the first technical cleanup sprint.
